I am poor on Social Security and cannot even afford to back up one Terrabyte on SSDS because Five of them failed and they cost me money. So instead I bought bulk 10 bulkmemorycardscom also bulk 20 of -32GB or so USBFD, amazon-ebay have them also, PNY is a common brand, and what I do is store either ISO9660 or FAT32 on them, used to have exfat on larger ones, but can't afford shit anymore, my main data is 4.4 out of five gigs on a Veracrypt Partition I store on IA, encrypted spelled backwards, PWP, that is all I got there, I will get either PVC Badge Cards from Vistaprint or Zazzle, you can get 20 or 8 or those depending on preference, you can link in your main info on some PVCS or you can have a password and link like a total idiot, your choice, so anyways I was doing that, and I had the idea of storing everyhing that way every bit of data as an LINKPW on a PVC followed by another PVC and not having a Flash Drive or Having them only in the back pack and lock box then I have the raster with link on 2 email clouds protongm, the phone mtp of course as zip tar 7z and targz with the rasters deleted that being jpg png pdf and gif deleted for just the archive iles in a directory and on the root directory of the phone, I degoogle the phone, root it, netguard, then that is it for F-Droid. No email linked on my phone, that is another topic, but my main point is I can everything stored in my d-bag ridge wallet and not have to carry a stupid obnoxious FD or Dumb SSD when USBC will just quit if you put it in your pocket like da, so there is that godzilla read this and died, I use fat32exfatiso9660 for flash drives, ext4ntfsfat32luksexfat for Solid State Drives, I never use Hard Drives or Optical, only for gaming if someone wants me to play, that is all for that one ... ; EOF. ;
